

SeniorMove:

A Personalized

Senior Moving

Application

Prepared For:

Michael Bilek
Tammy Bilek

Honoring Aging
333 N. Randall Rd. Suit #2
St. Charles, IL

Prepared By:

Ryan Riebesehl

Version 1.0 • Confidential

1. Introduction

1.1 Purpose of this Proposal:

This proposal outlines the design and development of a custom mobile (can also be web) application for Honoring Aging. The application, temporarily called SeniorMove for now, is built specifically to reduce the stress and confusion for senior citizens and their families during the moving process, which can be one of life's most overwhelming transitions.

1.2 About this Document:

This document will walk you through every part of the project: what the app does, how it is built, what technologies are used, a rough estimate of what it costs to run, and discussions of pay/hiring or freelancing. Meant to be understandable for audiences with no technical background.

1.3 Why This App Matters:

The senior moving industry is growing fast as the Baby Boomer generation ages. Most moving apps are currently built for young, tech-savvy customers. A senior-first app that connects to Honoring Aging's existing scheduling and customer tools in a simple, easy-to-read format is genuinely rare and valuable. Making this mobile application a meaningful project worth building.

1.4 What the App Will Do:

Here is an idea of what a client will experience when they use SeniorMove:

- Download the app on their iPhone or Android phone (or use it on a computer).
- See a simple, large-text dashboard showing their upcoming move, key dates, assigned team members for moveout/estimates, etc.
- An interactive calendar to see when movers will arrive, when packing starts, when the new home walkthrough is scheduled, etc.
- Receive gentle reminders via push notifications, text, or email when a task is approaching its due date.
- View a checklist of everything they need to do before the move, with checkboxes they can tap when done (or it automatically checks when a form is completed).
- See photos and contact info of the movers and specialists who will be helping them.
- Send a message securely through the app without needing to find someone's phone number or email.
- View the interactive floor plan in the app of their new home to help plan where furniture will go.

- Track the status of special services: downsizing, home sale prep, liquidation, referrals, etc.
- Will include back buttons to go to the previous page and confirmation buttons to ensure this is what the user wants to do.

2. Services Being Digitized

The app needs to support some of the services at Honoring Aging. Here is each service and how the app would support it:

<u>Service:</u>	<u>Meaning:</u>	<u>How the App Supports it:</u>
Personalized Moving Plan	Custom plan for each client based on their situation	Client dashboard, assigned tasks, timeline tracker
Downsizing	Sorting, deciding what goes and what doesn't	Checklist with categories, photos can be uploaded
Custom Floor Plan	A computer diagram of the new home showing where things go	Interactive floor plan viewer inside the app (if possible)
Packing & Unpacking	Company staff help pack at the old home and unpack at the new home	Scheduling calendar, crew assignment with photos
Special Senior Support	Extra care and support for seniors and their families	Family member app access, care notes
Home Sale Preparation	Getting the old home ready to sell	Task checklist with deadlines and photos
Liquidation	Selling or donating unwanted belongings	Status trackers, referral directory inside the app
Referral Services	Recommending real estate agents, donation centers	Referral directory inside the app with contact info

3. Target Users

3.1 Primary Users: Senior Citizens:

- Many are not comfortable with technology but are becoming more so each year.
- Vision may be reduced, requiring large text and high contrast.
- Requires large buttons, may have finger dexterity.
- May be overwhelmed by too many notifications at once.
- Trust is important, must feel safe & professional.
- Most will likely access the app on a smartphone (iPhone or Android).
- Clients should receive a welcome email that says “Tap here to set up your app”. Link takes them to a screen that only asks them to create a password, then an account should be set up.

3.2 Secondary Users: Son/Daughter of Senior Citizens / Family Members:

- Can often help the move on behalf of their parents from place to place.
- More comfortable with technology and want real-time updates.
- Want to stay informed without needing to call every day.
- Likely use the app more to do data entry/completion of tasks.

3.3 Internal Users: Company Staff:

- Staff can use the app to see their scheduled assignments for the day.
- Can update task statuses and communicate with clients through the app.
- Management can see all active clients and their progress.

3.4 Design Principle:

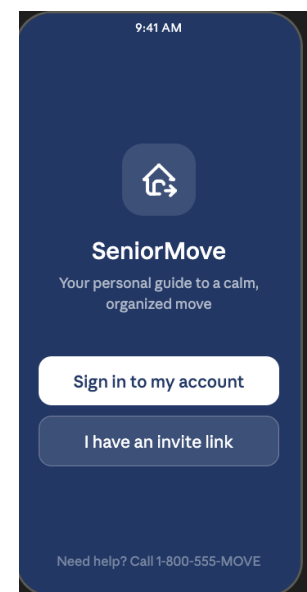

A senior-first UI/UX, meaning font size of around 18px, large buttons (48x48 pixels), simple navigation with fewest options as possible on the screen, calming blue and white color scheme, no jargon, and an option to contact the company directly from the app at any time.

4. Full Feature List & Description

4.1 Welcome Screen:

The first screen the client sees when they open the app, shows:

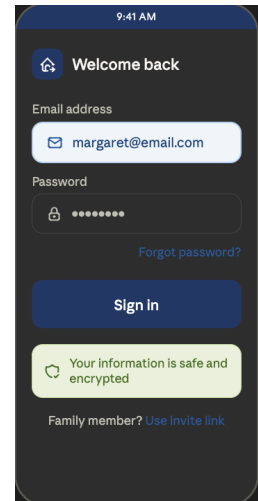

- App name with short description
- Sign in to the account
- Invite link/code for family members
- Assistance to call if needed

4.2 Sign-In Screen:

Second screen a client sees when selecting “Sign in to my account”:

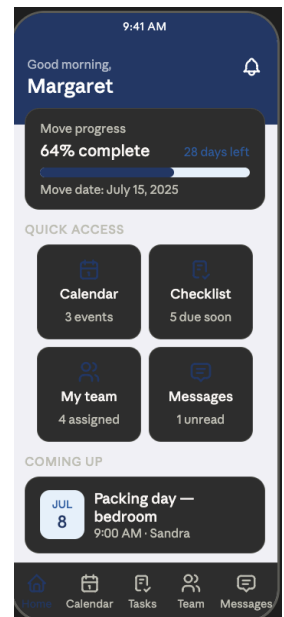

- A welcome message
- Area to enter email address & password
- Forgot password button
- Sign in button to get to the dashboard homepage
- Message reiterating information is safe and encrypted
- Another invite link option for family members who accidentally clicked sign in

4.3 Client Dashboard (Home Screen):

The next screen a client sees when logging in successfully:

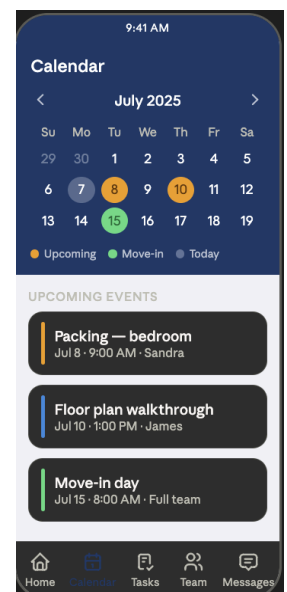

- Their name and a warm greeting (“Good morning, ...!”)
- Days until their move date, shown as a large countdown
- A summary of upcoming tasks due for current week
- Quick-access buttons to Calendar, Checklist, My Team, and Messages
- Progress bar showing how complete their move preparation is

4.4 Moving Calendar:

A simple visual calendar that shows:

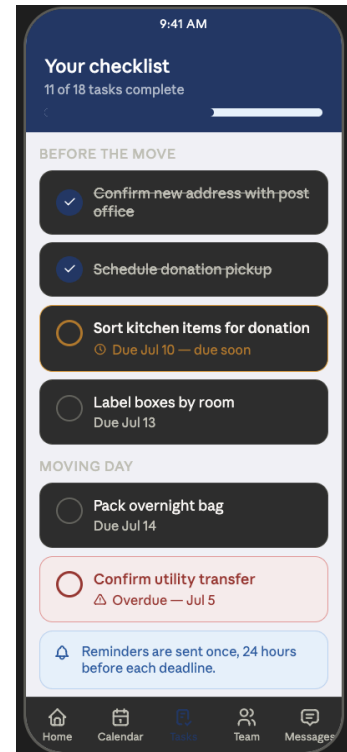

- Move-out date, move-in date, packing days, estate sale dates
- Appointments with individual team members (with photo, name, contact info)
- Color-coded events: blue = scheduled, green = completed, orange = upcoming
- Synced with ConnectTeam so updates appear automatically

4.5 Task Checklist & Reminders:

A categorized to-do list assigned to the client by the company:

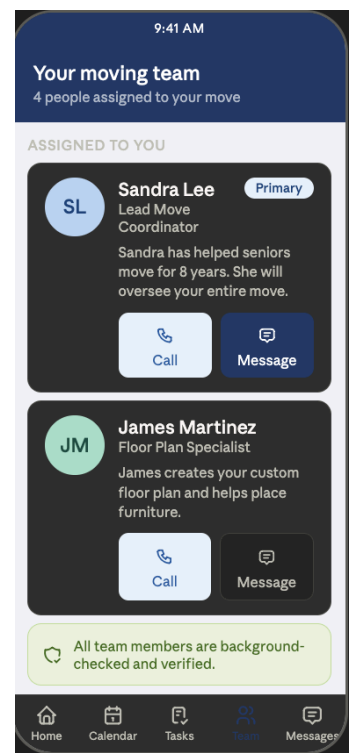

- Tasks organized by category: “Before the Move”, “Moving Day”, “After the Move.”
- Each task has a due date and a checkbox the client can tap when done (or automated if it's a form)
- Automated reminders sent 24 hours before a deadline via push notification, text, or email
- Reminder frequency will be low to prevent overwhelming users
- If task is overdue, follow-up reminder is sent once

4.6 Meet Your Team (Crew Directory):

Page showing the people assigned to the client's move. Each person would have:

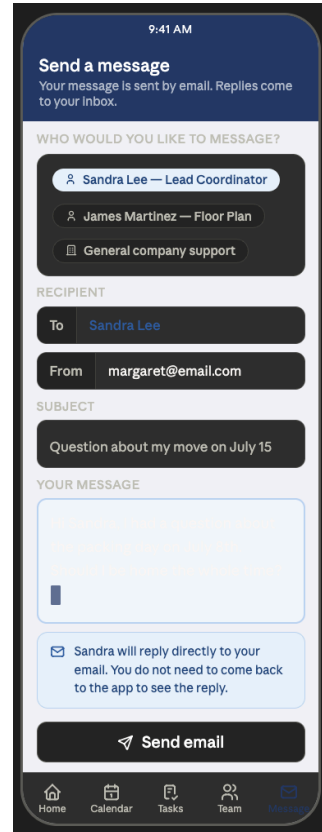

- A professional photo, name, role
- Phone number or email that can be tapped to call or email directly
- Short bio or description so the client knows who to expect at the door
- Reduces anxiety for seniors who are nervous about letting strangers into their home

4.7 Secure In-App Messaging:

Simple chat or messaging interface so clients can communicate without leaving the app:

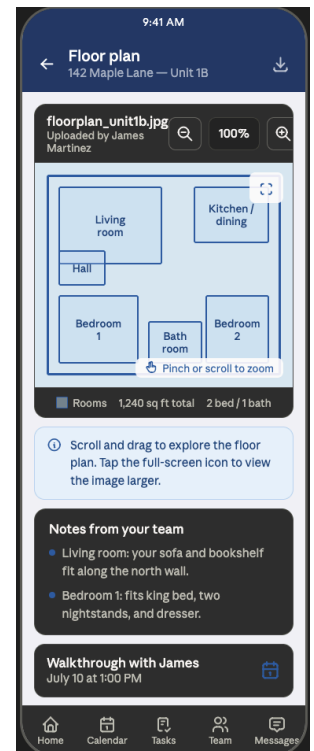

- Messages go to the assigned team member or company support
- Large text input box, simple send button
- All messages are stored securely and can be reviewed by company management
- Clients do not need to navigate to another app
- Email is sent to the team member when message arrives

4.8 Floor Plan Viewer:

Screen where clients can view the layout of the new home through the app:

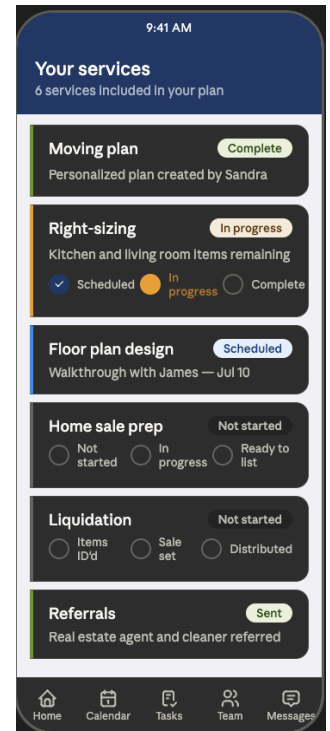

- Company staff upload a floor plan image
- Client can zoom in and out, scroll around the floor plan
- This helps clients see where their furniture will go before moving day at any given time

4.9 Service Status Tracker:

Simple status view showing where each company service stands:

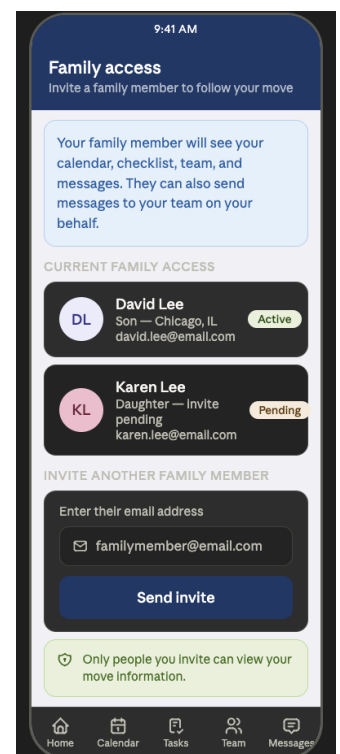

- Downsizing consultation (scheduled/ in progress / complete)
- Home sale preparation (not started / in progress / ready to list)
- Liquidation (Items identified / sale scheduled / proceeds distributed)
- Referrals (referral sent / client contacted / service confirmed)

4.10 Family Member Access:

The client can invite a son/daughter/family member to view the app:

- Family member receives an email invitation with login link/code
- Can see everything the client sees: calendar, checklist, team info, messages
- Can also send messages to the team on behalf of the client
- Beneficial for families coordinating a move from different states

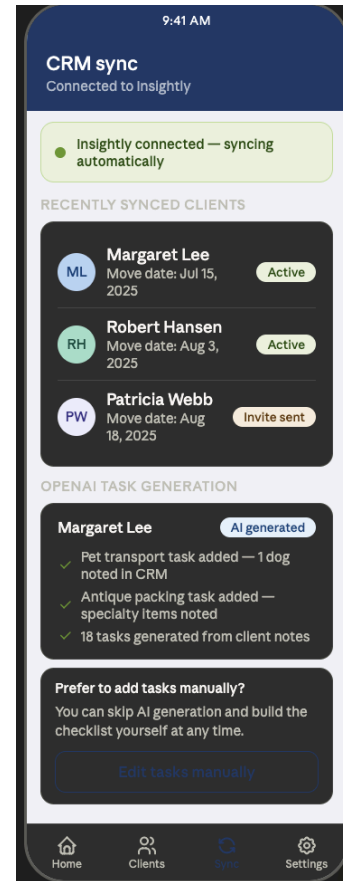

**** On the staff/admin side ****

4.11 CRM Integration (Insightly + Open AI) [Tasks are written on paper, transfered to app]:

The app would connect to the company's existing Insightly CRM system:

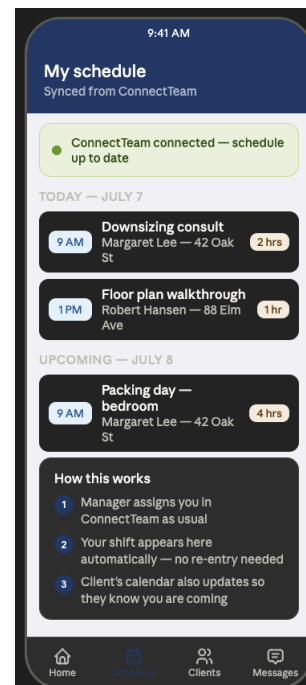

- When a new client is added in Insightly, their profile automatically appears in the app
- Client contact info, move dates, and service notes sync from Insightly
- Open AI can be used to auto-generate task checklists based on the client specific situation (if they have pets, checklist includes pet transportation tasks). This can also be done manually with no OpenAI
- This connection uses Insightly's official API (set of rules that lets two software systems share data)

4.12 Scheduling Integration (ConnectTeam):

The app connects to ConnectTeam with ConnectTeam's API, which is already used for scheduling:

- When staff are assigned to a client's move in ConnectTeam, it appears in the client's calendar automatically
- Staff can see their own schedule inside the app as well
- Prevents the company from needing to manually enter scheduling data twice

4.13 Referral Directory (Optional) [Don't incorporate for now]:

A built-in contacts page for trusted partner the company recommends:

- Real estate agents, donation centers, junk removal, cleaners, storage facilities
- Each listing has a logo, name, phone, "Tap to Call" button
- The company controls which referrals are shown

5. Technology Stack Needed

This section explains what technology to use to build each part of the app. A collection of tools and programming languages that make the app work.

5.1 Front End (What the user sees):

Everything a user sees and touches on their screen, the visual layer.

<u>Technology:</u>	<u>What it does/ Why use it:</u>
React Native	Builds the mobile app for both iPhone and Android from one codebase
Expo	Simple React Native setup, lets you preview the app on your phone instantly
TypeScript	A version of JavaScript with fewer bugs; good for large projects like this
React Navigation	Handles moving between screens
Reactive Native Paper	Pre-built accessible UI components (buttons, cards, text)
Figma	Design tool for creating the visual mockups (used in project proposal)

5.2 Backend (Engine behind the app):

The backend code that runs on the server, not the user's phone. Handles storing data, checking logins, sending notifications, and connecting to third-party systems like Insightly and ConnectTeam.

Technology:	What it does / Why use it:
Firebase Authentication	Handles user logins and passwords securely without building it from scratch
Firebase Firestone	Cloud database that stores client info, tasks, messages and schedules
Frisebase Storage	Stores uploaded images
Firebase Cloud Functions	Runs automatic tasks (reminders)
Firebase Cloud Messaging	Sends push notifications to the users phone
SendGrid or Twilio (Optional)	Can send automated emails and text message reminders to clients

5.3 Database (Where data is stored):

Database:	Benefits:
Firebase Firestone	Best for starting out. No server to manage, real-time syncing, scale automatically. Pay only for what you use

5.4 Integration (Connecting existing tools):

Integration:	How it Works:
Insightly CRM	Has an official API. You send requests to pull client data into the app automatically. OpenAI can read those notes and generate a task list.
ConnectTeam	Also has an API, when staff are scheduled in ConnectTeam, the event appears in the client's app calendar within minutes.
OpenAI	Used to read client move notes from Insightly

	and can auto-generate a personalized checklist.
--	---

6. Cloud & Database Costs

These are ballpark ongoing monthly costs to run the app after it is built. Instead of buying your own physical computer services (which are expensive), you can rent space and computing power from companies like Google (Firebase), Amazon (AWS), or Microsoft (Azure). You pay only for what you use, like a utility bill. If few people use the app, you pay very little, if more people use it, you pay more but also could have many paying customers.

6.1 Phase 1: Small scale (1-50 Clients):

<u>Service:</u>	<u>Provider:</u>	<u>Monthly Cost:</u>
App Database (Firestore)	Firebase (Google)	\$0, free up to 50,000 reads a day
Login	Firebase Auth	\$0, always free
File Storage	Firebase Storage	\$0, free up to 5 GB
Push Notifications	Firebase Cloud Messaging	\$0, always free
Email Reminders (Optional)	SendGrid Free Tier	\$0, free up to 100 emails/day
SMS Text Reminders (Optional) Verizon	Twilio	\$15-20/month (1,000 texts)
Insightly CRM	Insightly	Paid
ConnectTeam	ConnectTeam	Paid
OpenAI API (task generation, optional)	OpenAI	\$5 - \$15/month at low usage
App Hosting (Web)	Firebase Hosting	\$0, free tier included
App Store Fees Hosting (Apple + Google) [Phase 2]	Apple / Google	\$99/ year Apple, \$25 one-time fee Google
Total Estimated (for now):		~\$0 for now, \$20 - \$35/month for optional features

6.2 Phase 2: Growing Scale (50-500 Clients):

TBD

7. Data Security & Privacy

Short overview of how data would be protected.

7.1 How Data is Protected:

- All data is encrypted in transit, meaning data traveling between the phone and the server cannot be read by anyone else, similar to how online banking works.
- If someone broke into Google's servers, your data would be unreadable without the encryption key.
- Each client can only see their own data. Staff can only see clients they are assigned to.
- Login requires email and password.
- All messages in the app are stored on the Firebase servers, not the client's device.

7.2 Compliance Considerations:

- HIPAA is not required, but best practices would still be worth following.
- CCPPA and similar IL privacy laws may apply. A privacy policy and terms of service document will be needed.
- Firebase is GDPR-compliant and SOC 2 Type II certified, and meets the gold standard for data security.
- If you work with clients' financial data (for liquidation), legal review of data handling practices recommended.

8. Rough Roadmap & Timeline

This is a rough order I made to build everything. Building in phases keeps the project manageable and lets you see progress quickly. I usually use Jira to keep track of tasks (free). Subject to change, some parts may take longer/shorter time.

<u>Phase:</u>	<u>What Gets Developed:</u>	<u>Estimated Duration:</u>
----------------------	------------------------------------	-----------------------------------

Phase 0: Design	All Figma screens designed, approved prototype	.5 - 1 week
Phase 1: Foundation	Firebase setup, user login/auth, basic navigation, client profile	2-3 weeks
Phase 2: Core Features 1	Dashboard, Checklist, Calendar	3-4 weeks
Phase 3: Core Features 2	Notifications, Team Directory	2-3 weeks
Phase 4: Communications	In-app messaging, email/SMS reminders, family access	3-4 weeks
Phase 5: Integrations	Insightly CRM connection, ConnectTeam scheduling sync	3-4 weeks
Phase 6: Advanced Features (Some of these may be optional)	Possible floor plan viewer, service tracker, referral directory, OpenAI tasks	3-4 weeks
Phase 7: Testing	Bug fixing, senior user testing, accessibility review	2-3 weeks
Phase 8: Launch	App stores submission (Apple & Google) staff training, client onboarding	2 weeks
Total Estimate (for now):		22-30 weeks (5-7 months)

Pay Options:

-Pay by hour, can log hours. Not to exceed any limits with flexibility, looking at a pay rate of around \$20 hr. (15 hours a week?)

-Log hours, update via Microsoft Teams`

Closing:

Thank you for your consideration! Looking forward to starting this project together!

Thanks,
Ryan Riebesehl
